PRISM SPECTROMETER

PHYL 202

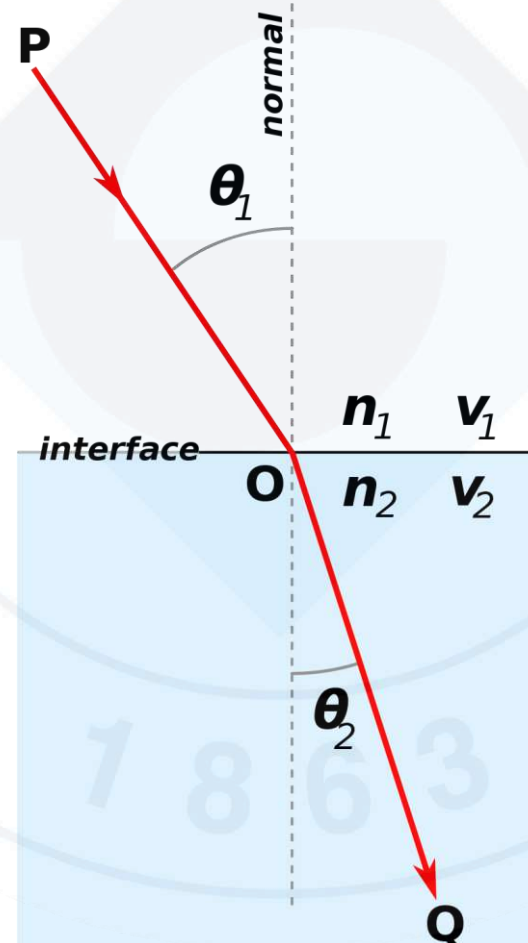

THEORY

- Snell's law states a relation between incoming and refracted angles between two different environments

$$n_1 \sin \theta_1 = n_2 \sin \theta_2$$

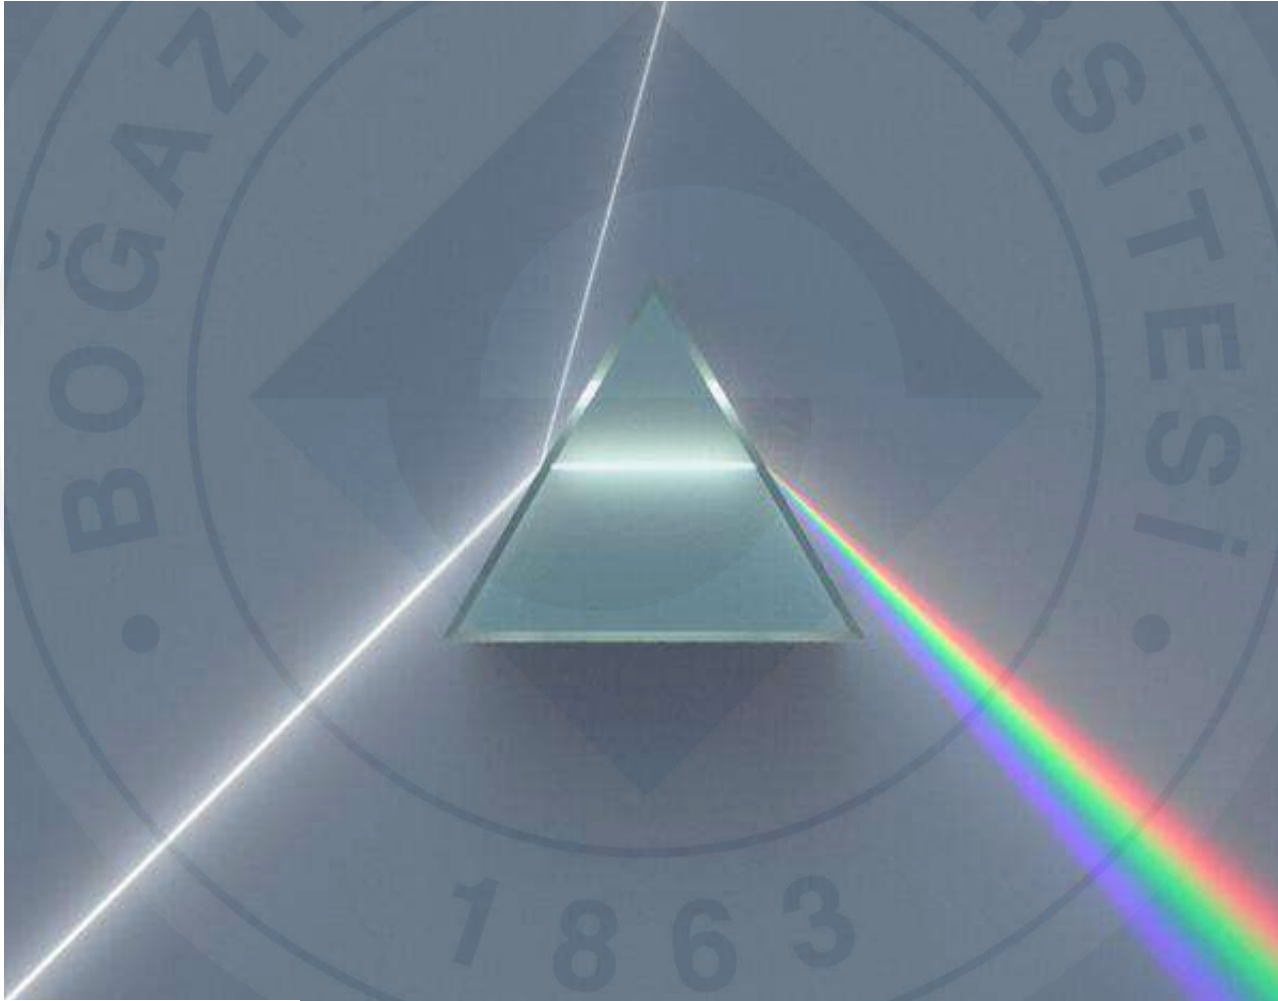

- But, if Snell's law would be the only equation that governs refraction, then why we would observe different lights coming out of a prism?
- There is one more equation that states the index of refraction of a material also depends on the incoming light.

$$n = A + \frac{B}{\lambda^2}$$

- In this experiment, we will examine the relation between index of refraction and wavelength of the light.

PRISM SPECTROMETER

Example of $n = A + \frac{B}{\lambda^2}$

WHITE LIGHT REFLECTION

Scheme for White Light Reflection

WHITE LIGHT REFLECTION – demonstration $0^\circ - 0^\circ$ match

$$58.5(12)^\circ$$

$$30 \times 0.5^\circ$$

$$12 \times x$$

$$x = 0.20^\circ \text{ (2 SF)}$$

$$58.70^\circ \text{ (2 SF after decimal point)}$$

$$298.5(15)^\circ$$

$$30 \times 0.5^\circ$$

$$15 \times x$$

$$x = 0.25^\circ \text{ (2 SF)}$$

$$298.75^\circ \rightarrow 360.00^\circ - 298.75^\circ$$

$$= 61.25^\circ \text{ (2 SF after decimal point)}$$

$$(58.70^\circ + 61.25^\circ) / 2 = 59.98^\circ = \alpha$$

WHITE LIGHT REFLECTION – demonstration $0^\circ - 180^\circ$ match

$$118.5(16)^\circ$$

$$30 \times 0.5^\circ$$

$$16 \times x$$

$$x = 0.27^\circ \quad (2 \text{ SF})$$

$$118.77^\circ \quad (2 \text{ SF after decimal point})$$

$$238.5(20)^\circ$$

$$30 \times 0.5^\circ$$

$$20 \times x$$

$$x = 0.33^\circ \quad (2 \text{ SF})$$

$$238.83^\circ \quad (2 \text{ SF after decimal point})$$

$$(238.83^\circ - 118.77^\circ) / 2 = 60.03^\circ = \alpha$$

WHITE LIGHT REFLECTION

Fill the empty spaces accordingly.

White light reflection:

Angle (left) θ_{left} =

Angle (right) θ_{right} =

Prism Angle α = $\frac{|\theta_{\text{right}} + \theta_{\text{left}}|}{2}$ $\frac{|\theta_{\text{right}} - \theta_{\text{left}}|}{2}$

0° -0° match

0° -180° match

PRISM SPECTROMETER

MERCURY LAMP

$$n = A + \frac{B}{\lambda^2}$$

A is y-intercept that is why you should start your x-axis from 0.

Scale your y-axis independently of your x-axis

- While drawing your line, try to even out your data points.
